Multiple reasons prompt students to change majors

Lauron Jackson

"Your major is not necessarily going to give you a job, but it can serve as a training for a particular career. It's going to teach you skills to be successful."—David Kincade, president of the Truman Career Center

It is not uncommon for students to change their minds, ideas and goals in college and for many to make the realization that college majors do not translate directly into jobs.

As of fall 2004, 48 percent of students were declared with one major, 22 percent were double majors and 30 percent were undeclared. Numerous percent of students who arrived at Truman with declared majors changed them within the first year, according to fall 2004 courses. The students also stated that after these years, 25 percent of students had at least one change.

Reasons that students change majors varies: a change of interest, difficulty in choosing a major, finding a faculty member and meeting their school's requirements.

Junior Nick Cox has said that he changed his major from business to accountancy at Truman.

"It was really an art major, but I didn't really last very long," Cox said. "I thought about going undeclared, but then I realized that I was really only interested in the visual part of it, and I had problems with the math part as well."

Cox, along with his major change, also changed his minor from psychology to English. "I think the psychology before really helped, English," Cox said. "But the visual part of it, the visual part, the way things are put together, is what I enjoy, and I enjoy writing."

Typically, psychology majors are surprised to know about graphic design and other similar information. "She then asked me what I enjoyed. I said I'd like to write and read books, so it was a perfect match," Cox said.

Students are not the only ones changing majors.
