Computer labs experience printing problems

The desktop icon that once indicated the intended printer.

The server sends the document to a printing queue, in this case the intended printer. The software in the queue is responsible for formatting the document according to the printer's specifications, and sending the formatted file to the printer. The printer then processes the file and prints the document.

The new printing software introduced this week. So far, students have been delayed due to a few issues.

Professor of philosophy and religion Vaughn Pultz, professor of chemistry, said the experience of traveling to the children's homeland and seeing their original family was an experience in itself.

"... It is a major inconvenience when (the printers) don't function properly for extended periods of time," Keisha Murray said.

"It's expensive to compile a dossier, which is a set of documents saying you want to adopt, and to translate it and send it to the adopting country," said Sarah Mohler, assistant professor of English.

"In China, we could get an infant little girl," Mohler said.

"My roommate in college was Chinese-American,“ she said. "She wrote me a one-year adoption letter, which is a set of documents saying you want to adopt, and to translate it and send it to the adopting country," said Sarah Mohler, assistant professor of English.

"I will never forget the day when they came home," she said, "the kids were so happy and on their way home."
