Mark Campbell, associate professor of agricultural science, said he has been breeding more nutritious corn for several years. While some of his students paint in off-campus apartments, some of his research is on campus, too.

“Producing healthier foods, I think, is where the future lies,” said Campbell.

Campbell and his son Bobby examine ears of corn in the field where Campbell does most of his research.

“Campbell’s research is not just about corn, but about agriculture in general,” said Steve Peeler, heating, ventilation and air-conditioning professor for Truman.

While the world looks upward for pollution, “the University community can’t afford to look up,” Peeler said.
